

LALLEMAND'S CLEANFEED APPROACH

Lallemand Animal Nutrition works hard to protect your silage and maintain herd health and performance.

STEP 1

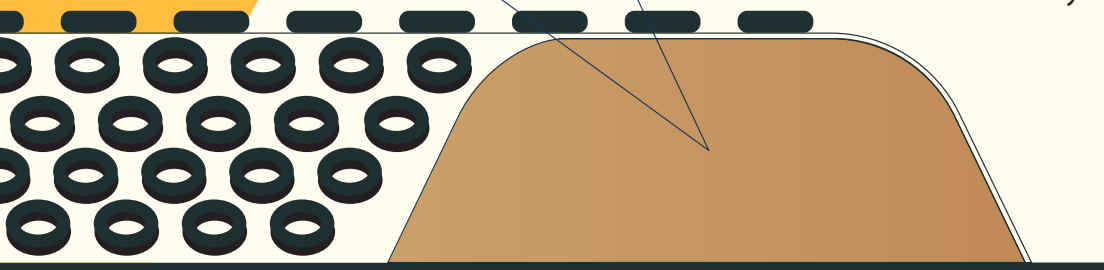

APPLY INOCULANT AT HARVEST

MAGNIVA Forage Inoculants contain research-proven lactic acid bacteria and high-activity enzymes that optimize the fermentation process.

PROTECT SILAGE IN STORAGE

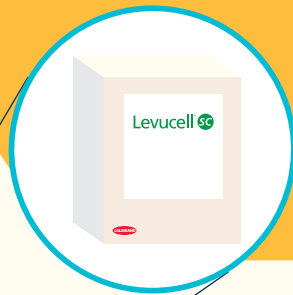

During fermentation, there are good and bad microorganisms in the pile. MAGNIVA Forage Inoculants preserve the forage, promoting beneficial fermentation bacteria, thus enhancing nutrient retention, dry matter and feedout stability.

STEP 2

INCLUDE A PROBIOTIC IN YOUR RATION

By supporting the animal's digestive system, nutritionists and producers can help maximize diet digestibility and achieve consistent animal performance.

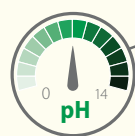

ENHANCED RUMEN FUNCTION

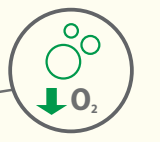

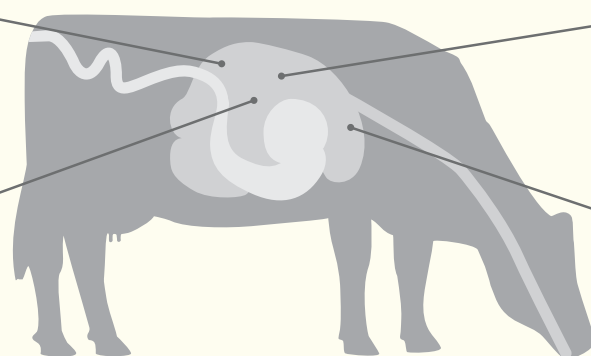

Feeding LEVUCCELL SC optimizes rumen function, which is essential to building a strong foundation for lifelong animal well-being and performance, and producer profitability.

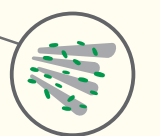

Microbiota Balance

Rumen pH

Anaerobic Condition

Fiber Degradation
